

Storage instructions

Safety edges storage.

Proswitch safety edges are properly packed for the delivery. If the product is not going to be used immediately once arrived to destination, it is highly recommended to store the sensing edges according to the following instructions:

- open packages as soon as possible and lay them on a flat surface;
- do not place the sensing edges one over the other and do not lay anything on them;
- do not entangle the cables;
- preserve the sensing edges in a repaired and dry environment, at a temperature between 10°C and 24°C;
- keep the sensing edges linear, avoiding any bending and fold;
- dislocate the sensing edges keeping space among each one;
- if not assembled, dislocate separately the aluminium edge channels;
- avoid any contact with dust and any other chemical substances;
- in case of long storage period, inspect the product and carry out the proper checks before its installation.

Components storage.

Rubber, terminals and caps:

displace housing edge longitudinally, avoiding any bending or fold.;

keep the housing edge, the terminals and the caps in dry and repaired environments, at a temperature between 10°C and 24°C, keeping enough space among each one without laying anything on them.

Aluminium edge channel:

store the aluminium edge channel on a flat surface, avoiding any bending or fold.

Inner sensor and cables:

keep the sensor on the sprocket on which it was provided, in horizontal position, in dry and repaired environments, at a temperature between 10°C and 24°C.

The cables must be stored accordingly to the electrical storage standards.
